

## What's the youngest patient you've seen with catatonia?

**Dr. Dhossche:**

I think about 10, 11. 10, 11. I think this has been my youngest patient, but I've read reports of cases that were younger. But I have not personally seen them.

I think it's possible that you can recognize it in younger children, four or five, but I haven't seen it.
